

Nature's Way Cooperative releases its Research and Extension Program Strategic Review for 2006 - 2016

Nature's Way Cooperative (NWC), has recently released a report entitled "Review of the Nature's Way Cooperative (Fiji) Ltd. Research and Extension Program and proposals for the future (2006 - 2016)". This report covers ten years of research and extension work supporting Fiji's fresh produce export sector and gives valuable insight into the opportunities and challenges for farmer organisations involved in research and extension.

This review was commissioned by the NWC management and board and supported through the EU funded SPC PAPP project. The review is intended as a management tool and for the information of NWC's 300 members who make up the cooperative. NWC remains a leading example in the Pacific region of the important contribution a farmer organisation can make to agricultural research and extension when it works in an appropriate partnership with government and private sector.

Nature's Way Cooperative (Fiji) Ltd (NWC) was formed in 1995 to undertake mandatory quarantine treatment on behalf of Fiji's fruit export industry for four commodities, namely, papaya, eggplant, mango and breadfruit. NWC's core business is the quarantine treatment of fruit fly host products and also provides an effective field service (NWC Research and Extension) to closely support this.
